

BREATHE THE DIFFERENCE

mining and tunneling experts

Körfmann

“BREATHE THE DIFFERENCE”

The Best laid plans can fail.
We guarantee that they won't.

For any challenge regarding underground worksites we offer the appropriate solution – however tough the requirements may be. Because Korfmann Lufttechnik GmbH does not only develop, construct and install ventilation systems, it also provides the conception and service for it. Offering a unique dimensioning layout of the ventilation system may include heating, cooling or dedusting, for example. And if our systems are to be used in urban spaces we will render acoustic simulations to come up with solutions to meet civil requirements and standards.

Pinpoint any location!
We'll get it there.

Handling the logistical process of ventilation systems we look back on more than 100 years of mining history providing us with the proper experience and expertise. Our engineers apply this extensive know-how to transport material into restricted working environments. Especially to those with limited spaces prevailing at underground worksites. Either compactly packed in quickly installable containers or divided for optimised transport underground. A comprehensive and easy-to-understand set of collation and packaging lists facilitate logistics handling while minimizing incurring costs.

No need to know it all.
We can teach you.

Maintenance and servicing by Korfmann Lufttechnik GmbH offers the best guarantee for satisfactory operation of our systems and the preservation of high-level resilience and longevity. As a further option supplementing our range of products and services we offer specifically trained technicians to provide direct assistance for all ventilation systems. Maintenance, air-pressure monitoring, vibration analyses or emissions measurements are only some of the training options to choose from. We gladly provide full life-long support for your projects, production engineering and service.

Where energy flows ...
... our focus goes.

Developing, constructing and installing sturdy high-quality ventilation systems isn't where we stop. In fact it's where we begin optimisation using Korfmann software which has been developed specifically to obtain and control the necessary ventilation-related data. Once that data is retrieved by our engineers they will adjust the economical control technology with regard to the highest energy efficiency possible. Of course, this also includes the provision of the necessary statistical proof to ensure our customers' satisfaction while lowering their energy costs.
